

Registration Interface

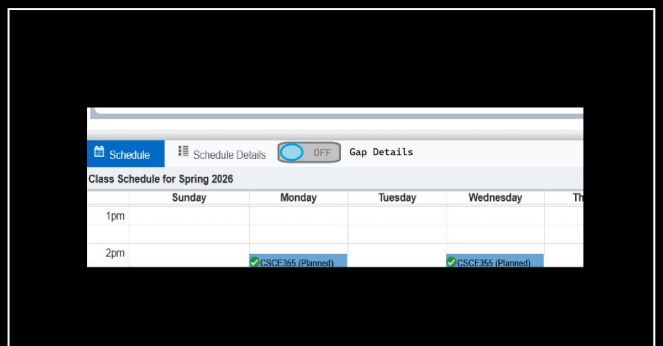

When planning a schedule or registering for classes, the user will have a visual indication of "good vs bad" gaps in between courses.

When the user hovers over the gap they will see the To and From information. A "bad" gap could include, short time between class, distance, or route difficulties.

When the user hovers over the gap they will see the To and From information. A "good" gap is some threshold of time between, time of travel, and route difficulties.

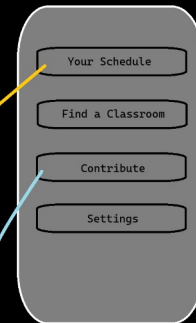

The user can turn on or off the gap information.

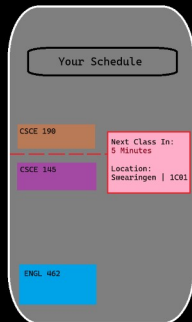

Mobile App Option

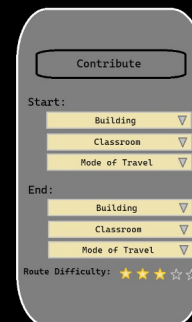

All students can use and contribute via a simple mobile app. From a lost student on their first day of class. To any student that want's their school schedule on their phone. Or a student that wants to contribute to route data.

After opening the app, the user will see the available options. No accounts necessary.

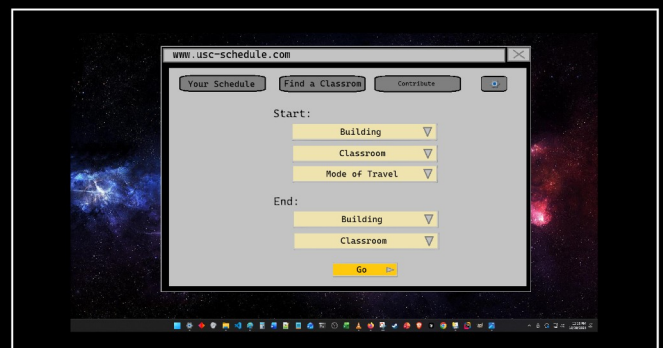

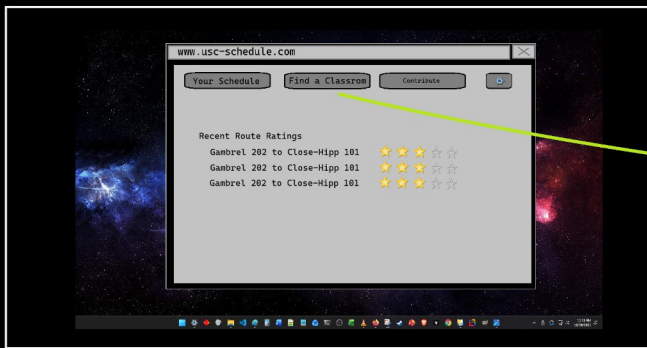

Through some blackbox method, the student can upload their schedule information. When they view their schedule, the app will track what day of the week and time, and show the user their next class information.

All students can contribute to the route difficulty ratings, This lets new students get information about hard routes, such as walking from Swearingen to Close-Hipp.

Browser Option

The browser option provides a simple interface for students to look at their schedule, input their routes, and read route reviews.

sc.edu/visit/map, has a nice interface already for directions, I would like to incorporate the route reviews by students, as well as be more specific with classrooms.

You can also add your schedule and the site would automatically create directions for you, in addition to providing class gap information, such as time in between, time of travel, etc.
